Insight Beyond Eyesight For Locating Caries

The Midwest Caries I.D.TM detection handpiece is a new technology that aids doctors in the location of interproximal and occlusal caries that might otherwise go undetected. Powered by proprietary technology, the Caries I.D. uses LED and Fiber Optic technology to positively identify caries with 2 clear signals: a visual signal on the tooth as well as an audible tone.

The Caries I.D. detection handpiece can aid in locating caries in pits, fissures and interproximal areas on posterior teeth that have not been restored. Unlike other detection devices, it requires only a clean tooth surface, free of plaque and calculus, prior to use to be effective. It's also locating lesions and decalcification in X-Ray adverse patients.

Independent studies suggest the Midwest Caries I.D. can detect 92%* of occlusal and 80%** of interproximal caries. This unmatched level of detection can help clinicians craft and deliver improved treatment plans for their patients.

For more information on the Midwest Caries I.D., contact your DENTSPLY Sales Representative. You can also call us toll free 800.989.8826 or visit us online at www.professional.dentsply.com or www.cariesid.com.

* 92% sensitivity based on a histological gold standard.

** 80% sensitivity based on a radiographic gold standard.
